

215 Supper Club Digital Passport - Development Plan

Phase 1: Planning & Setup (Week 1)

1.1 Setup Data

- Setup **Users** Google Sheets structure with columns:
 - `user_id` (unique, auto-generated)
 - `first_name`
 - `last_name`
 - `instagram_handle`
 - `passport_color` (hex code or preset options)
 - `created_date`
 - `unique_url` (generated from `user_id`)
 - `is_admin` (T/F admin controls)
- Create related sheets:
 - **Master_Locations:** `location_id`, `place`, `stamp_color`, `date_set`, `is_active`
 - **Locations:** `user_id`, `place`, `date_visited`, `stamp_date`
 - **Objects:** `user_id`, `place`, `object_type` (book/film/etc), `object_name`, `notes`, `date_added`
 - **Food:** `user_id`, `place`, `dish_name`, `date_added`
- Use Google Forms for signup → auto-populate Google Sheets

Phase 2: Backend Setup (Week 2)

2.1 Google Apps Script Development

- [] Write function to generate unique user IDs
- [] Create function to generate unique URLs with autopopulating the web app script and integrating with the unique user ID
- [] Build API endpoints for:
 - Get user data (GET)
 - Update passport color (PUT)
 - Add location/stamp (POST)
 - Add object with notes (POST)
 - Add food item (POST)
- [] Implement data validation (lowercase Instagram handles, etc.)

2.2 Admin Specific Functions

- Create admin authentication (simple check against your `user_id`)

- Build "Set Location" endpoint (POST) that:
 - Adds new country/location to master Locations list
 - Makes it available in all user dropdowns
 - Choose the color for that location's asterisk stamp

2.6 Admin Add-ons:

1. **Viewing all members** - You might want a way to see who has stamped their passport for the current location (attendance tracking)
2. **Location management** - Ability to edit/delete locations if you make a typo
3. **Statistics view** - Quick view of how many members have:
 - Signed up total
 - Attended each location
 - Added objects/food for current location

Phase 3: Frontend Development (Weeks 3-4)

3.1 Passport Dashboard - Cover View (reference page 1 of Passport PDF)

- Integrate Google Sheet 'Users' so that the unique URL will open the user's specific passport cover
- [] Design passport cover interface
- [] Implement color selector (preset swatches: pink, purple, blue, green, red, orange, yellow, white, three different shade options for each but nothing dark because black font needs to be readable) - button is on the top left, just an asterisk symbol that they click
- [] Create "open passport" button
- [] Save color preference to database

3.2 Passport Dashboard - Interior View

- [] Create main dashboard layout
- [] Build progress tracker component:
 - Super clubs attended (total number of stamps for user vs. total stamps of admin which is me)
 - Progress bar visualization
- [] Design locations/stamps display section
- [] Create design for object button
- Place display, each one a different color asterisk but are the same across users per country (clickable, creates a popup that includes the object type, object name, and food associated with that place)
- [] Create design for food button

3.3 Interactive Features

- [] "Add Object" button creates a popup:

- Begin typing place, select from dropdown (admin will have created this already)
- Object type selector
 - book
 - movie
 - poem
 - fine art
 - documentary
 - other: have user type in
- Object name input
- Notes: can be edited by selecting the object (clicking “currently viewing”)
- Auto-populate date
- [] "Add Food" form:
 - Select place dropdown
 - Dish name input
- [] Create "Stamp Passport" feature:
 - Place selection
 - Stamp button again to confirm (automatically adds a “stamp” with the associated object and food etc on the passport)
- [] Build edit/delete functionality for entries

3.4 Admin Functions

- Add "Set Location" button to your passport (visible only to admin)
- Create "Set Location" popup form:
 - Location/country name input
 - Optional: Color picker for this location's stamp asterisk
 - Save button

Key Technical Considerations

Quick Win Option (Fastest to Market):

1. Use Google Forms for signup → auto-populate Google Sheets
2. Google Apps Script for web app backend
3. Simple HTML/CSS/JavaScript frontend
4. Host via Google Apps Script as a web app (no external hosting needed)
5. Use a QR code generator library (like qrcode.js)
